

THERMOSTATIC SHOWER MIXER WITH THREE-WAY DIVERTER

ADDITIONAL INFORMATION

The thermostatic shower system features two valves that allow you to keep water temperatures consistent each time the shower is used and create a customized shower system..

Valve A operates as a standard three-way shower diverter. This valve is able to connect to up to three different outputs. If only two outputs are desired, close the third output with a threaded brass plug (provided). The three-way diverter valve allows you to alternate between any of your outputs by directing the water from the shower head to each additional accessory, one at a time and features an On/Off switch to turn your shower on and off.

Valve B connects conventionally to your hot and cold water supply with the hot water on the left and the cold water on the right. This valve is used to control the water temperature only, it will not turn the water on or off.
